

Bug Report:

Bug Title: LLM chat stays active even after selecting only one model.

Module: Model Selection & Chat Interface.

Environment: QA Web App

Priority: High

Description:

In Chat, a model is auto-selected, and the user manually selects a second model; the chat interface switches to LLM chat as expected. However, if the user then unselects the chosen model, the interface continues to show LLM chat instead of reverting to Agentic chat. This behavior also blocks access to MCP Server responses and disables history tracking.

Steps to Reproduce:

1. Open the chat interface with default model auto-selected.
2. Manually select a second model.
3. Observe that LLM chat is enabled.
4. Unselect the selected model.
5. Observe that LLM chat remains active and Agentic chat is not restored.
6. Try accessing the MCP Server or history features.

Expected Result:

Unselecting the model should revert the interface to Agentic chat and re-enable MCP Server and history access.

Actual Result:

LLM chat remains active, Agentic chat is not restored, and MCP Server/history features are blocked.

Impact:

Users are unable to return to Agentic chat or access server-based responses and chat history, leading to confusion and broken workflows

Bug Title: Dark Mode Not Applied to Pattern, Invite Code Preferences, and GRT Lab Sections.

Module: UI Theme – Dark Mode

Environment: QA Web App

Priority: High

Description:

When dark mode is enabled across the application, certain sections, specifically Pattern, Invite Code, Preferences, and GRT Lab, do not reflect the dark theme styling. These areas retain light mode visuals, causing inconsistency in the user interface and reducing accessibility for users preferring dark mode.

Steps to Reproduce:

1. Log in to the QA application.
2. Enable dark mode from the settings or dashboard.
3. Navigate to the Pattern section.
4. Open Invite Code Preferences.
5. Visit the GRT Lab tab.

Expected Result:

All sections of the application should switch to dark mode styling consistently.

Actual Result:

Pattern, Invite Code Preferences, and GRT Lab sections remain in light mode while the rest of the application reflects dark mode.

Impact:

Creates visual inconsistency, affects readability, and may confuse users expecting a unified theme experience.

Bug Title: Empty File Picks Up Entries from Another Uploaded File.

Module: Data Masker & Entity Extraction

Environment: QA Web App

Priority: High

Description:

When multiple files are uploaded—specifically three files, including one empty file—the system incorrectly assigns entries from one of the non-empty files to the empty file. This leads to inaccurate data mapping and misrepresentation of file contents.

Steps to Reproduce:

1. Navigate to the file upload section.
2. Upload three files: two with valid content and one completely empty.
3. Observe the entity extraction or pattern assignment for each file.
4. Select the empty file and inspect its entries

Expected Result:

The empty file should not display any entries or extracted data.

Actual Result:

The empty file incorrectly shows entries from one of the other uploaded files.

Impact:

This causes confusion in data validation, breaks traceability, and may lead to incorrect pattern application or analysis.

Test Case

Test Case 1: Verify Traffic Light Functionality with Agentic Chat + MCP Server

Objective: Ensure the traffic light indicator works correctly when Agentic chat is active and the MCP Server is enabled.

Test Steps:

1. Open the chat interface.
2. Select Agentic chat mode.
3. Ensure the MCP Server is enabled.
4. Send a message and observe the traffic light indicator.

Expected Result:

- The traffic light should appear and reflect the response.

Status: Pass

Test Case 2: Verify Prompt Optimization Functionality with Agentic Chat

Objective: Ensure Prompt Optimization works correctly when Agentic chat is selected.

Test Steps:

1. Open the chat interface.
2. Select Agentic chat mode.
3. Enter a prompt and click "Optimize."
4. Observe the optimized prompt output.

Expected Result:

- Optimized prompt should appear below or beside the original.
- Optimization should reflect improved clarity or structure.

Status: Pass
